Core Document

Equitable Earth Standard

Summary

This document sets out the overarching rules and requirements applicable to all projects certified under the Equitable Earth Programme. It outlines the foundational principles, general eligibility criteria, and project design requirements, as well as monitoring, reporting, and verification requirements. These requirements apply to all projects and must be followed in conjunction with the applied methodology.

1 Introduction

1.1 Normative References

- 1.1.1 This document must be read in conjunction with the applied methodology and the following documents:
 - Programme Manual [public consultation version]
 - Registry Procedures [to be revised]
 - <u>Terms & Definitions</u> [to be revised]
 - <u>Validation and Verification Procedure</u> [to be revised]

1.2 Scope

- 1.2.1 The scope of the Equitable Earth Programme encompasses projects that implement ecosystem restoration and/or conservation activities and apply an Equitable Earth methodology.
- 1.2.2 The scope of the Equitable Earth Programme explicitly includes project-based activities. The current version does not permit the development of programmatic, jurisdictional, policy, or sectoral approaches for crediting.
- 1.2.3 Unless specified in the applied methodology, there are no restrictions regarding project size. The Standard does not require a minimum or maximum land area or net greenhouse gas (GHG) reduction or removal capacity.

1.3 Effective Dates

- 1.3.1 This version of the Standard becomes applicable on November [TBD], 2025. All developers submitting a <u>Feasibility Study Report</u> on or after this date must conform to this version.
- 1.3.2 Projects that submitted a <u>Feasibility Study Report</u> before the effective date may continue the certification process under the version applicable at the time of submission, unless developers choose to update to the current version.

1.3.3 Equitable Earth reserves the right to request alignment with partial or all updated requirements if deemed necessary.

2 Principles and General Requirements

All projects seeking certification under the Equitable Earth Programme must conform to the requirements outlined in this section, as well as the requirements of the applied methodology and other referenced documents.

2.1 Principles

Three-Pillar Approach

- 2.1.1 Equitable Earth certifies projects that are designed to generate additional benefits in:
 - 1) **Ecological condition:** Projects must be designed to conserve and/or restore ecosystems to their native state, including the conservation and/or restoration of native biodiversity and ecosystem services.
 - Carbon: Projects must restore and/or conserve natural carbon sinks to help limit the rise in global temperature, in line with the Paris Agreement.
 - 3) **Livelihoods:** Projects must empower Indigenous Peoples (IPs) and Local Communities (LCs) and foster opportunities for improved livelihoods.

GHG Accounting Principles

- 2.1.2 Equitable Earth operates the Equitable Earth Programme in line with the following GHG accounting principles:
 - 1) **Relevance:** Equitable Earth selects GHG sources, sinks, reservoirs, and related parameters relevant to the project type.

- 2) **Completeness:** Equitable Earth includes all GHG emissions and GHG removals, as follows:
 - a) Each methodology includes relevant GHG sources, sinks, and reservoirs and may omit a GHG source, sink, or reservoir by virtue of its design elements (eligibility criteria) or where it is not considered for conservative purposes.
 - b) Equitable Earth employs the Global Warming Potential (GWP) metric following the IPCC Assessment Report 6 (AR 6)¹ and uses a 100-year horizon.

Table 1. GWP Values

GHG sources	GWP-100
Carbon dioxide: CO ₂	1
Methane (fossil): CH ₄	29,8
Methane (non-fossil): CH₄	27
Nitrous oxide: N₂O	273

- 3) **Innovation:** Equitable Earth promotes and employs new and innovative methods, technologies, and procedures that are scientific and evidence-based.
- 4) **Accuracy:** Equitable Earth reduces bias and uncertainties as far as practically possible.
- 5) **Conservatism:** Equitable Earth deliberately and systematically applies a conservative approach to quantifying net GHG reductions and removals, ensuring that estimates do not overstate the actual project outcomes.

¹ Intergovernmental Panel on Climate Change (IPCC). 2021. Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. Chapter 7: 'Understanding and attributing climate change' Table 7:15, page 1018.

- a) In estimating overall uncertainty, all causes of uncertainty are considered, including the baseline scenario, parameters, equations, and measurements.
- 2.1.3 Equitable Earth aligns with the <u>Aboveground Woody Biomass Product Validation</u>
 Good Practices Protocol²:
 - 1) **High-quality reference data:** Equitable Earth verifies that the AGB provider integrates field campaigns with individual tree measurements and airborne LiDAR data to provide accurate and reliable biomass estimates.
 - 2) **Consistency in definitions and metrics:** Equitable Earth adheres to standardised definitions for Above Ground Biomass Density (AGBD), typically measured in Mg/ha or t/ha, and follows validation metrics such as bias, uncertainty, precision, and accuracy.
 - 3) **Calibration and validation data:** Equitable Earth ensures that calibration data are independent of validation datasets.
 - 4) **Error propagation and reporting:** Equitable Earth quantifies and propagates errors from measurements, models, and geolocation processes to the final AGB estimates. Uncertainty is calculated using standardised methods and reported following IPCC or CEOS good practices guidelines.
 - 5) **Field measurement recommendations:** Equitable Earth assesses whether the AGB provider follows field measurement recommendations, including the use of square plots, preferred plot sizes, accurate measurement of tree diameter, height, and wood density, and contemporaneous field and satellite data collection.
 - 6) **Airborne LiDAR validation:** Equitable Earth assesses that the AGB provider uses airborne LiDAR data, which meets the protocol's recommendations for LiDAR data specifications, spatial and temporal matching, and coverage of field plots and surrounding areas.
 - 7) **Usage of satellite data:** Equitable Earth assesses that the AGB provider addresses spatial mismatches between plot and satellite pixel sizes, and bridges the scale between ground plots and satellite pixels using airborne LiDAR data.

² Committee on Earth Observation Satellites (CEOS). (2021). Protocol for the field measurement of biomass for validation of global remote sensing-based biomass estimates: Version 1.0. NASA Goddard Space Flight Center.

- 8) **Independent validation:** Equitable Earth conducts independent validation using high-quality reference data from <u>Sylvera</u>. Additionally, Equitable Earth assesses that the AGB provider validates its model with independent data. This involves using fully independent, higher-quality datasets, including airborne LiDAR-derived biomass estimates, ground LiDAR, UAV LiDAR, and field plots.
- 9) **Uncertainty quantification:** Equitable Earth computes the uncertainty of AGB and root-to-shoot ratio to determine the overall uncertainty in total biomass and CO₂e using standardised formulas and methods.

For more information on how these principles are applied across calculations, refer to the quantification requirements in the applied methodology.

2.2 Conformance with Equitable Earth Principles and Methods

- 2.2.1 The Standard establishes minimum requirements for project design, implementation, monitoring, and reporting.
- 2.2.2 Projects must meet and demonstrate conformance with the requirements and procedures established in this document.
- 2.2.3 Projects must apply the latest version of the Equitable Earth Standard.
 - 2.2.3.1 Registered projects may update to the latest version of the Standard at verification.
- 2.2.4 Projects must apply the latest version of the applicable methodology and its associated tools, procedures, and guidelines, and demonstrate conformance with its criteria and procedures.
 - 2.2.4.1 Registered projects may update to the latest version of the applied methodology at verification.
 - 2.2.4.2 Projects must update to the latest version of the applied methodology at crediting period renewal.

2.2.5 Equitable Earth reserves the right to require projects to update to the latest version of the Standard or applied methodology.

2.3 Application of a Methodology

- 2.3.1 Projects must select the latest version of the applicable methodology approved by Equitable Earth and demonstrate conformance with its requirements, including those related to:
 - 1) Eligibility criteria
 - 2) Ecological condition pillar
 - 3) Livelihoods pillar
 - 4) Carbon pillar, including the corresponding quantification requirements of the applied methodology, specifically:
 - a) Determination of project boundary, including selection of relevant GHG sources, sinks, and reservoirs
 - b) Demonstration of additionality
 - c) Quantification of net GHG reductions and removals, including:
 - i) Determination of the baseline scenario and baseline emissions
 - ii) Determination of project GHG reductions and removals
 - iii) Determination of project emissions
 - iv) Determination of leakage
 - v) Uncertainty and associated parameters
 - d) Determination of GHG reversal risks and a reversal mitigation plan
 - e) Monitoring and reporting of achieved net GHG removals and project interventions
- 2.3.2 Projects must establish the baseline scenario for each pillar according to the latest version of the applicable Equitable Earth methodology.

2.3.3 A methodology may provide further criteria and requirements for a specific project activity type.

2.4 Double Counting and Double Registration

The net GHG removals from project activities must not be double-counted. To ensure this, Equitable Earth utilises robust procedures, as set out in the <u>Registry Procedures</u> and the <u>Programme Manual</u>. More specifically, double-counting is prevented through the measures set out in this section.

Double Registration

- 2.4.1 No double registration: Equitable Earth will only issue units for GHG reductions or removals that are solely registered with Equitable Earth. If a project has previously been registered with another GHG programme, proof of withdrawal or de-registration must be provided, in line with the requirements in Sections 2.4.7 2.4.17 below.
- 2.4.2 **Unique project areas:** All project areas must be unique and cannot overlap. Developers may only initiate activities that are not located in project areas of existing projects.
 - 2.4.2.1 Project areas that are or have been registered as part of a project under other GHG programmes are only eligible for Equitable Earth certification if that project is withdrawn and no longer active with the other programme. See Section 2.4.12(5).

Double Issuance

- 2.4.3 **Unique issuance:** Only one Equitable Carbon Unit (ECU) is issued for each 1 tCO₂e of net GHG removal achieved.
 - 2.4.3.1 ECUs cannot be issued for achieved net GHG reductions or removals under both Equitable Earth and a national, regional, or local emission trading system, binding limit, or compliance system.
- 2.4.4 **Serialisation of units:** All units are serialised, meaning they are assigned a unique serial number to ensure a distinct identity. Refer to the <u>Labelling and Serialisation</u> procedures in the <u>Registry Procedures</u> for more details.

- 2.4.5 **Robust Registry procedures:** To prevent double issuance, the Equitable Earth Registry includes the following features:
 - 1) Transparent management of the issuance, transfer, retirement, and cancellation of ECUs.
 - 2) Details about the beneficiary and the calendar year (i.e., vintage) for which the offsetting requirement is fulfilled through the retirement.
 - 3) Impossibility to transfer, retire, or cancel already retired ECUs.
 - 4) Public disclosure of all project documentation. Refer to the <u>Registry</u> Procedures for more details.

Double Claiming

2.4.6 To effectively mitigate the risk of double claims in the context of international mitigation purposes other than NDCs, or other purposes, developers must follow the procedure described in the <u>Avoiding Double Claiming Procedure</u>.

Transferring from another GHG Programme

? Equitable Earth proposed new requirements and procedures for projects seeking to transfer to Equitable Earth from other GHG programmes. In the public consultation, we'd like your feedback and any recommendations to improve the clarity and applicability of the proposed requirements.

- 2.4.7 Projects under development or registered with another GHG programme may transfer to the Equitable Earth Programme.
- 2.4.8 Projects seeking to transfer must be eligible in the current scope of the Equitable Earth Programme and supported by an existing Equitable Earth methodology.
- 2.4.9 Projects seeking to transfer must apply and demonstrate conformance with the requirements in the latest versions of the Equitable Earth Standard and applied methodology.
- 2.4.10 Projects that were seeking registration with or were registered under other GHG programmes must provide proof that the project has been withdrawn

from the other programme before being eligible to register with the Equitable Earth Programme. Additional information and examples of proof can be found in Section 5.4.4 of the Programme Manual.

- 2.4.11 Projects rejected by another GHG programme may be eligible to transfer to the Equitable Earth Programme. Such projects must provide:
 - 1) Proof of rejection (e.g., official communication from the administrator of the other GHG programme, 'rejected' status on the other registry);
 - 2) Official evidence detailing the reasons for rejection; and
 - 3) Proof that the reasons for rejection are not relevant to any Equitable Earth requirements and/or that the project is or will be in conformance with Equitable Earth Programme and methodology requirements.
- 2.4.12 The following applies to all projects transferring to Equitable Earth:
 - 1) The project start date must meet the requirement in Section 3.4.1.
 - 2) The project must have been submitted to the other GHG programme within three years of the project start date, in line with the requirement in Section 3.4.3.
 - 3) The total duration of the crediting period must not exceed the maximum crediting period allowed under Equitable Earth (i.e., projects transferring would not be able to credit under Equitable Earth beyond the end of the crediting period under the other programme).
 - 4) Monitoring periods must be contiguous (i.e., the first verification period under Equitable Earth starts the day after the last day of the verification period under the other programme).
 - 5) The project area must remain the same as the project area under the other GHG programme.
- 2.4.13 Projects seeking to transfer must undergo the full certification process with Equitable Earth.
- 2.4.14 Conversion of credits issued under another GHG programme to ECUs is not permitted under this version of the Standard.
- 2.4.15 Any credits deposited in the pooled buffer account of the other GHG programme must be handled in line with the other programme's rules and

- procedures. Unreported losses detected by Equitable Earth during the final verification period under the previous programme must be compensated following Equitable Earth requirements.
- 2.4.16 Once transferred, projects must follow the requirements set out in Sections 6.3.8 6.3.17 regarding buffer contributions, losses, and reversals for the proportion of credits issued under the Equitable Earth Programme.
- 2.4.17 Equitable Earth reserves the right not to accept projects seeking to transfer from another GHG programme.

3 Project Design Requirements

3.1 Compliance

3.1.1 Projects must demonstrate conformance with relevant local, regional, and national laws, regulations, and policies, and applicable universal agreements or international conventions. This includes requirements and obligations related to safeguarding the rights of IPs and LCs.

3.2 Project Governance and Management

- 3.2.1 Developers must maintain a team of personnel with the requisite expertise to fulfill all technical and administrative needs commensurate with the size and scope of the project.
- 3.2.2 Developers must establish and maintain a qualified³ project team that includes:
 - 1) A project manager with onsite presence who is responsible for the overall coordination of the project and ownership of the project's work plan.
 - 2) Personnel to carry out project start-up and collaborative engagement and decision-making processes. Personnel may be in-house, or secured

³ Team members' qualifications should be commensurate with the needs of the position in the specific context of the project.

- through partnerships or consultancies, with expertise in the areas of administration, finance, livelihoods, ecological and biodiversity assessment, and community engagement.
- 3) In-house capacity and capabilities and/or partnerships to design and conduct collaborative and robust monitoring for socio-economic, ecological, and biodiversity indicators.
- 4) A local community engagement team with experience in participatory action, facilitation, and social equity, who are responsible for ongoing community dialogue and collaborative decision-making for project activities, and ensuring all team members are well-trained on how to interact with the communities.
 - a) At least one person on the local community engagement team should be responsible for ongoing community dialogue, consent, and partnership-building for project activities during the design phase.
- 5) A specialist, either in-house or through partnerships, responsible for and managing to prevent and address human rights issues, including issues related to discrimination and workplace harassment.
- 3.2.3 Developers must ensure that all project team members, regardless of position, have the capacity to appropriately and effectively engage with IPs and LCs.
- 3.2.4 Developers must respect and reinforce local and customary decision-making systems, local committees, and other community-selected representatives that meaningfully, effectively, and inclusively represent IPs, LCs, and other stakeholder groups.
- 3.2.5 Developers must have policies and procedures in place to ensure no discrimination or sexual harassment occurs, human rights are respected, and no project activities use forced labour, child labour, or victims of human trafficking. The policies must be documented and should be included in employee codes of conduct and shared with contractors prior to contract signing.
- 3.2.6 Developers should integrate and devolve management responsibility at the most local level feasible.
- 3.2.7 Developers should employ community members, especially if the required experience, expertise, and skills are available or can be developed through dedicated capacity building and training programs.

- 3.2.8 Developers should ensure that if no women, vulnerable stakeholders, or local community members apply for higher-level positions, or who meet requirements for those positions, every effort will be made to hire and train them for future opportunities.
- 3.2.9 Developers should develop and update annually a detailed work plan that outlines the specific tasks and timelines required to implement the project activities and interventions, team roles and responsibilities. The work plan should be agreed upon with local project partners and stakeholders.

? Equitable Earth proposed new requirements for the composition of project and field teams. In the public consultation, we'd like your input and insights from your practical experience as to whether these requirements are appropriate and reasonable for a variety of project contexts.

3.3 Geography and Project Boundaries

Project Location and Boundaries

- 3.3.1 Equitable Earth projects may be developed anywhere across the globe. A methodology may limit the geography of eligible projects.
- 3.3.2 Projects must clearly define and document their geographic boundaries and spatial extent by:
 - 1) Specifying the physical delineation and geographic area, including the limits such as city, state, region, country, along with geographical coordinates in the form of shapefiles.
 - 2) Providing the name of the project area (e.g., specific name or number allocation).
 - 3) Supplying maps and geospatial files (e.g., shapefiles or KML files with geodetic polygons) that precisely denote the project area, considering any exclusion zones.
 - 4) Describing the project boundary with diagrams or flowcharts.

- 3.3.3 The project boundary must clearly indicate all the relevant GHG sources, sinks, and reservoirs included in the project. Any exclusions must be adequately justified.
- 3.3.4 Developers must identify any communal areas and/or areas with customary ownership inside the project area.
- 3.3.5 Developers must identify and map any ongoing or unresolved land ownership disputes in the project area.
- 3.3.6 If IPs and LCs are identified as project stakeholders, developers must consult them on the zonation as part of participatory mapping requirements. The final zonation must be confirmed by IPs and LCs.
- 3.3.7 If the project area spans multiple ecosystems and/or biomes, developers must indicate different groups as part of the zonation.
- 3.3.8 Where proposed interventions span across boundaries of more than one national jurisdiction, developers must submit separate projects for each jurisdiction.

3.4 Key Project Dates and Crediting Period

- 3.4.1 The project start date corresponds to the date on which project activities that will result in GHG reductions or removals begin.⁴
- 3.4.2 The project registration date corresponds to the publication date of the <u>Project Design Document</u> (PDD) on the Equitable Earth <u>Registry</u>, following its validation by a validation and verification body (VVB).
- 3.4.3 Developers must submit projects to Equitable Earth within 3 years of the project start date.

? Equitable Earth requires all developers to submit projects within three years of the project start date. In the public consultation, we'd like your input on the appropriateness of the three-year time frame.

⁴ Examples include but are not limited to preparing the restoration site, planting seedlings, signing an FPIC agreement, or the official designation of a protected area.

Crediting Period

- 3.4.4 The project crediting period includes the time during which the project implements and monitors activities and is eligible to issue ECUs. It also covers the period during which any reversals must be compensated.
- 3.4.5 The initial project crediting period is 40 years beginning on the project start date or registration date, whichever is earlier.
- 3.4.6 To allow for progressive ambition, the PDD must be revised and adapted every four years. Refer to the <u>MRV Procedures</u> section for more details.
- 3.4.7 The initial crediting period cannot be extended.

Crediting Period Renewal

- 3.4.8 The crediting period may be renewed in 20-year periods, not to exceed 100 years in total from the project start date.
- 3.4.9 To renew the crediting period and demonstrate that the project still delivers measurable and additional impacts, developers must:
 - 3.1.1.1 Demonstrate conformance with the requirements in the latest versions of the Equitable Earth Standard and methodology.
 - 3.1.1.2 Undergo reassessment by Equitable Earth and revalidation by a VVB.
 - 3.1.1.3 Complete the crediting period renewal process within 12 months after the end of the current crediting period.
- 3.4.10 Refer to the <u>Renewal of Crediting Period</u> section of the <u>Programme Manual</u> for more details on the procedure.

3.5 Ownership and Carbon Rights

- 3.5.1 To ensure project legitimacy and compliance, developers must demonstrate that they possess the legal right to operate on the designated land and benefit from the resulting ECUs.
- 3.5.2 Developers must demonstrate ownership and carbon rights for the entire crediting period through the following options:

- 3.1.1.4 When land tenure is held directly by the developer, they must submit a valid property title.
- 3.1.1.5 When land tenure, including customary land tenure, is held by a third party, the developer must demonstrate exclusive and indisputable right for the entirety of the crediting period via a binding and enforceable agreement signed with the rightsholder(s)
 - 3.1.1.5.1. If the rightsholder(s) are designated as IPs or LCs with statutory or customary rights, the agreement must be made in line with FPIC requirements and procedures.
- 3.1.1.6 In cases where carbon rights are not intrinsically attached to the land tenure, two different binding and enforceable agreements must be signed with the rightful rights-holders.
- 3.5.3 All documentation submitted by the developer must demonstrate the absence of conflicting disputes over land tenure.

3.6 Pre-Submission Activities

- 3.6.1 Pre-submission activities must meet the requirements set out in this document and the applied methodology.
- 3.6.2 Projects must report on pre-submission activities during the feasibility phase in line with the requirements set out in the <u>Reporting</u> section and the <u>Certification Procedures</u> outlined in the <u>Programme Manual</u>.
- 3.6.3 Projects must submit evidence justifying that carbon credits were considered as an alternative to funding the project before initiating pre-submission activities. Acceptable proof includes, but is not limited to, e-mail exchanges, consultation reports, consultancy reports, contracts, and letters of authorisation.

3.7 Risk Management

- 3.7.1 Equitable Earth conducts a risk assessment and analyses all project risks in the following categories:
 - 1) **Delivery Risk Risk of failure to deliver.** All risks that threaten the capacity of developers to deliver the project.

- 2) **Reversal Risk Risk of avoidable and unavoidable reversal.** All risks that pose a reversal threat.
- 3) Equitable Earth Requirements Risk Risk of non-conformance with an Equitable Earth requirement. All risks that threaten project conformance with an Equitable Earth Requirement.
- 3.7.2 Equitable Earth pre-identified a set of risks. Developers may include additional project-specific risks. When identifying new risks, developers should consider:
 - Tangible and intangible sources of risk
 - Vulnerabilities and capabilities
 - Changes in the external and internal context
 - Limitations of knowledge and reliability of information
 - Time-related factors
 - Biases, assumptions, and beliefs of those involved
- 3.7.3 Risks that are methodology-specific must be identified accordingly.
- 3.7.4 Developers must:
 - 3.1.1.7 Review the risks identified by Equitable Earth
 - 3.1.1.8 Implement mitigation measures and monitoring protocols for relevant risks
 - 3.1.1.9 Report annually on all mitigation and monitoring measures
- 3.7.5 Refer to the <u>Risk Assessment</u> section in the <u>Programme Manual</u> for more details.

3.8 Financing and Project Budget

- 3.8.1 If developers secure part of the funding through sources other than the sale of ECUs, such sources must be included in the additionality demonstration and proven insufficient to cover project costs.
- 3.8.2 Developers must provide a comprehensive project budget, detailing estimated and realised expenses.

- 3.8.3 At the start of the adaptive management process, developers must provide an estimated budget for the next four years.
- 3.8.4 Developers must report annually on realised project expenses.

? Equitable Earth requires all projects to provide a comprehensive project budget, including information on benefit and revenue sharing. Currently, the project budget must be published on the Equitable Earth Registry. In the public consultation, we'd like your input on how we can ensure transparency while protecting sensitive information.

4 Livelihoods Pillar

This section sets out requirements specific to the Livelihoods Pillar.

4.1 Baseline Assessment

- 4.1.1 Developers must establish a livelihoods baseline by assessing the following attributes for each identified community:
 - 1) **Livelihoods**: living standards, health, infrastructure, climate change adaptation.
 - 2) **Cultural heritage and governance:** project ownership, respect for collective rights and security, cultural values and well-being, and sustainable management of heritage.
 - 3) **Employment and fair wages:** wealth creation, quality employment, improved skills and knowledge, safety and ethics of employment.
- 4.1.2 Developers must conduct the baseline assessment in partnership with IPs, LCs, and other relevant stakeholders.

4.2 Stakeholder Engagement

This section sets out requirements for stakeholder identification, communication, engagement, and consultation. These requirements are applicable to all projects. The requirements in Sections 4.2.16 - 4.2.25 apply to projects that include IPs and LCs as stakeholders.

General Requirements

- 4.2.1 Developers must engage with all stakeholders during project design and implementation, and throughout the project lifetime.
- 4.2.2 Projects must be designed based on the needs and aspirations of stakeholders across social, economic, cultural, and spiritual domains.
- 4.2.3 Developers must initiate stakeholder engagement in the early stages of project development to ensure comprehensive stakeholder mapping, collect feedback, and secure stakeholder involvement.
- 4.2.4 Developers must establish accessible and ongoing communication channels that allow stakeholders to request information, ask questions, raise concerns, and provide feedback throughout the project lifetime.
- 4.2.5 Stakeholders may submit grievances through the Equitable Earth Grievance Mechanism. Developers must ensure that all stakeholders are informed about the mechanism, know how to use it, and can access it without barriers. Specifically, developers must:
 - 4.2.5.1 Provide training to communities and ensure that communities fully understand the purpose of the grievance mechanism, how to submit a grievance, their rights related to use of the mechanism, and the systems in place to protect their security and identity.
 - 4.2.5.2 Demonstrate that information about the grievance mechanism is documented and accessible to all communities, workers, and stakeholders in appropriate languages.

Refer to the <u>Equitable Earth Grievance Mechanism</u> section in the <u>Programme</u> Manual for more details.

Stakeholder Identification and Mapping

- 4.2.6 Developers must identify, classify, and map all stakeholders participating in, impacting, or directly and indirectly impacted by the project. Stakeholders or stakeholder groups may include:
 - IPs and LCs
 - Rights holders, including customary rights holders
 - Vulnerable stakeholders
 - Neighbouring communities
 - Local non-governmental organisations (NGOs)
 - Local or regional government bodies
 - Community-based organisations
- 4.2.7 Developers must map stakeholders according to their type (e.g., core, direct, indirect, other) and influence.
 - 4.2.7.1 At feasibility, developers must conduct an initial stakeholder mapping exercise. The initial stakeholder mapping must include:
 - 1) Identification of the project stakeholders.
 - 2) Definition of key roles and assessment of levels of involvement, including whether and how the stakeholders are impacted by and/or impact the project.
 - 3) Assessment of whether project activities could encroach on stakeholders' land, displace any stakeholders, or restrict their access to resources.
 - 4.2.7.2 At feasibility, developers must strive to identify past and existing social conflicts or unresolved grievances. If conflicts or grievances are identified, developers should have a local mediator assisting in the resolution process.
 - 4.2.7.3 Developers must refine and complete the stakeholder mapping exercise at the design phase and update it throughout the crediting period, as needed.

Stakeholder Engagement Plan

- 4.2.8 At feasibility, developers must design a stakeholder engagement plan for the engagement and consultation with all identified stakeholders throughout project design and implementation.
- 4.2.9 The stakeholder engagement plan must include:
 - 4.2.9.1 The stakeholders or stakeholder groups to be engaged
 - 4.2.9.2 An engagement process tailored to each group
 - 4.2.9.3 A description of which topics should be communicated to each group, including through existing customary decision-making systems
 - 4.2.9.4 A description of the different channels of engagement, tailored to each group
 - 4.2.9.5 The frequency of engagement with each group
- 4.2.10 Developers must consult stakeholders on the content of the engagement plan.

Stakeholder Communication and Engagement

- 4.2.11 Developers must engage project stakeholders regarding all aspects of project design. This includes, but is not limited to, delimitation of the project area, baseline assessments, definition of objectives, intervention planning, and results monitoring.
- 4.2.12 Developers must tailor the level and type of engagement based on the stakeholder type and their influence, as set out in the stakeholder engagement plan. All stakeholders, regardless of type, must at a minimum receive information about the project and have the opportunity to provide input.
- 4.2.13 Stakeholder engagement and community consultations must continue regularly throughout the project lifetime to ensure ongoing participation. Developers must:
 - 4.2.13.1 Document stakeholder engagement activities (e.g., dissemination of information to indirect stakeholders, recordings of meeting attendance)
 - 4.2.13.2 Document stakeholder suggestions related to project design and implementation, including whether and how those suggestions were addressed.

- 4.2.14 Developers must report on stakeholder engagement and community consultation in the <u>Project Design Document</u> and <u>Annual Reports</u>. Developers must provide supporting evidence, which may include presentations, meeting minutes, feedback notes, and recordings.
- 4.2.15 Developers must establish a stakeholder committee, as follows:
 - 4.2.15.1 Developers must ensure each stakeholder group selects one individual to be their representative on the committee. The representative must be:
 - 1) Legitimately appointed by the group they are representing
 - 2) Able to communicate with developers to ensure information exchange between them and the community
 - 3) Compensated by their function as part of the project's actions, and if collectively agreed upon

Engagement with IPs and LCs

The requirements in this section apply to any project directly or indirectly impacting the lands, territories, and resources of IPs, and LCs holding statutory or customary rights to the land.

- 4.2.16 Developers must co-design a collaborative engagement and decision-making process and obtain FPIC⁵ during the design phase and throughout the crediting period.
- 4.2.17 Developers must communicate and engage with IPs and LCs in a culturally appropriate form and medium at all times and allow adequate time for discussion, feedback, and consensus building.
- 4.2.18 At feasibility, developers must obtain early support from IPs and LCs. This includes:
 - 4.2.18.1 **Hosting an initial in-person meeting** with community leaders, presenting the Equitable Earth Programme, project goals, and anticipated benefits.

⁵ The Equitable Earth FPIC process was adapted from: Food and Agriculture Organization of the United Nations (n.d.) 'Indigenous People Free, Prior and Informed Consent' Available at: URL (Accessed 24/05/2024)

- 4.2.18.2 **Building trust** by clarifying the potential value of the project and enabling leaders to influence its development to promote community engagement.
- 4.2.18.3 **Documenting consent** from IPs and LCs by recording agreements and endorsements in line with the requirements below.
- 4.2.19 Throughout project design and implementation, developers must hold in-person consultation meetings with IP and LC community leaders and members in order to conduct stakeholder and participatory mapping, design a participatory communication plan, and reach mutual consensus, as set out below.

Stakeholder and Participatory Mapping

- 4.2.20 During stakeholder mapping, developers must:
 - 4.2.20.1 In partnership with IPs and LCs, identify and document all IPs and LCs impacted by the project, recognising their language, customs, communication channels/media, and customary rights, including to the territory.
 - 4.2.20.2 In partnership with IPs and LCs, assess and document their governance system and structure, and identify their designated representative(s) and those who are legitimately authorised to represent them in consultations, negotiations, decision-making, and consent-seeking processes, including how the representative(s) was selected.
 - 4.2.20.3 Present the Equitable Earth Programme and the nature, mandate, and goals of the project to identified IPs and LCs.
 - 4.2.20.4 Identify the applicable legal frameworks the project must comply with.
- 4.2.21 Developers must conduct participatory mapping to document geographic and demographic information. Specifically, developers must:
 - 4.2.21.1 Ensure all IPs and LCs related to the project are equitably involved in the participatory mapping process.
 - 4.2.21.2 Document IP and LC land and natural resources history and usage.
 - 4.2.21.3 Identify IP and LC 'non-negotiables' (e.g., geographic areas that are off-limits).

- 4.2.21.4 Identify spiritual practices or traditional ethical codes that must be observed.
- 4.2.21.5 Identify high conservation values (HCVs).
- 4.2.21.6 Identify the existence of mobile communities migrating seasonally across the territory or depending on it for their livelihood.

Participatory Communication Planning

- 4.2.22 Developers must design and implement a participatory communication plan in partnership with IPs and LCs. The plan must:
 - 4.2.22.1 Include information needs, communication channels, and activities.
 - 4.2.22.2 Ensure the timely provision of materials in formats and languages accessible and intelligible to the IPs and LCs, preferably in their language and respecting traditional and customary protocols.
 - 4.2.22.3 Include norms for both verbal and non-verbal communication if necessary.
 - 4.2.22.4 Acknowledge IPs' and LCs' right to refrain from decision-making if they are not undoubtedly certain of something.
 - 4.2.22.5 Document the proceedings and outcomes of the discussions and make them available to all parties.
 - 4.2.22.6 Provide information about the <u>Grievance Mechanism</u> and explain how IPs and LCs can utilise it to raise and resolve issues throughout the project lifetime.

Free, Prior, and Informed Consent (FPIC)

- 4.2.23 Developers and IPs and LCs must reach a mutual and recognised consensus. Specifically, developers must:
 - 4.2.23.1 Demonstrate and document the process that was followed to design and refine project activities and interventions, including monitoring plan(s).
 - 4.2.23.2 Document which elements of the project are accepted and which require adaptation or abandonment when IPs or LCs oppose specific

- components of the project. Developers must adjust objectives to achieve mutual agreement among all parties.
- 4.2.23.3 Consider customary modes of decision-making and consensus-seeking to achieve consensus.
- 4.2.23.4 Establish a joint formal agreement with all participating IP and LC representatives that documents the consensus and key project information.
- 4.2.23.5 Ensure the agreement, supporting documentation, process details, and outcome of the process are publicly available to all IPs and LCs.
- 4.2.24 Developers must demonstrate that all IPs and LCs had sufficient time and capacity to participate in the agreement negotiations and reach consensus on the project. If the IPs and LCs do not agree to partnership and give consent after further engagement and/or changes to the project, developers must accept that the project will not proceed and must cease engagement.
- 4.2.25 Developers must monitor the evolution of agreements throughout the project crediting period. The monitoring must:
 - 4.2.25.1 Comprise diverse voices, including at least vulnerable stakeholders, to ensure their rights are equally respected.
 - 4.2.25.2 Offer and, when requested, maintain the anonymity of respondents.
 - 4.2.25.3 Developers must ensure verification results are shared through the designated communication channel, allowing IPs and LCs to confirm or contest the findings and request that a different VVB repeat the process if necessary.

4.3 Livelihoods Benefits and Safeguards

General Requirements

- 4.3.1 Projects must not harm stakeholder livelihoods and must deliver net positive livelihood benefits.
- 4.3.2 Projects must be designed and implemented to meet the requirements set out in Sections 4.3.3 4.3.47 below. Developers must demonstrate conformance

- with the requirements in the <u>Project Design Document</u> for assessment by Equitable Earth and validation by a VVB.
- 4.3.3 Developers must identify whether the project poses any potential risks related to these requirements. Where a potential risk is identified, projects must propose and implement measures to reduce and, as much as possible, mitigate impacts as part of a comprehensive social and environmental risk mitigation plan. Developers must report on the identification, mitigation, and monitoring of risks in the Project Design Document and Annual Report.

Human Rights

- 4.3.4 Projects must respect and protect universal human rights and freedoms as defined by the <u>Universal Declaration of Human Rights</u>, the <u>International Covenant on Economic</u>, <u>Social and Cultural Rights</u>, the <u>International Covenant on Civil and Political Rights</u>, and any other human rights instrument ratified by the project host country.
- 4.3.5 Projects must recognise, respect, and preserve Indigenous lands, collective rights, cultural heritage, and ancestral practices following the <u>United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP)</u>, particularly Article 3, and the <u>International Labour Organisation (ILO) Convention 169 on Indigenous and Tribal Peoples</u>.

Gender Equality and Women

- 4.3.6 Developers must protect against and appropriately respond to violence against children, women, and girls present in the project area.
- 4.3.7 Developers should increase opportunities for women's empowerment (e.g., through increased financial independence, training, capacity building, women's self-help groups, organisational capacity).
- 4.3.8 Where IPs and LCs are identified as stakeholders, developers must respect their local customs and traditional practices, which may include the assignment of specific roles based on gender.

Labour Rights, Livelihoods, and Working Conditions

4.3.9 Developers must treat workers fairly, provide equal opportunities, and provide equal and fair pay and compensation. This includes guaranteeing opportunities for professional development regardless of gender, socioeconomic, and racial

- backgrounds, and implementing transparent and fair recruitment, hiring, and compensation processes for all positions.
- 4.3.10 Developers must pay all project workers fair wages and, when available, in line with the country's living wage. In particular:
 - 1) If the country does not have an official living wage, developers must use the values indicated by the <u>Global Living Wage Coalition</u> as a reference.
 - 2) Workers occupying the same position and with the same level of experience must receive equal wages. Special attention must be paid to the context of gender equity. Any wage difference for workers occupying the same position must be justified.
- 4.3.11 Developers must not tolerate discrimination of any type, based on religion, caste, community, nationality, sexuality, or gender, among others, in the workplace.
- 4.3.12 Developers must forbid the use of forced labour, child labour, and trafficked people. Projects must comply with the ILO <u>Convention on Forced Labour (No. 29)</u> and ILO standards on occupational safety and health.
- 4.3.13 Developers must abide by the ILO <u>Declaration on Fundamental Principles and</u> Rights at Work and its Follow-Up.
- 4.3.14 Developers must ensure that all project employees work of their own free will.
- 4.3.15 When possible, developers should foster long-term employment with fixed contracts. When employing temporary workers, projects must have official affiliations through contracts or any applicable formal agreement.
- 4.3.16 Developers must provide a safe and healthy workplace throughout the project lifetime. This includes:
 - 1) Providing workers with safe access to the project area (e.g., commuting doesn't imply crossing conflict or unstable zones)
 - 2) Providing proper housing on the project site if workers must sleep at the project premises
 - Preventing exposure to physically dangerous working conditions, such as dangerous chemicals, dangerous wildlife, climate adversity, or unstable terrain

- 4) Providing access to Personal Protective Equipment (PPE) and other safety equipment.
- 4.3.17 Developers must protect the rights of contracted workers employed by third parties.
- 4.3.18 Projects must respond to and protect employees from aggressions and violence, whether physical, verbal or mental. Special attention must be paid to vulnerable stakeholders.
- 4.3.19 Projects should enable the development of alternative livelihoods and/or enhance existing ones.

Health and Well-being

- 4.3.20 Projects must improve health and well-being conditions, including but not limited to improving food security, securing access to clean water, and improving sanitation systems, where relevant.
- 4.3.21 Projects should reduce communities' vulnerability and promote socio-economic resilience to future extreme weather conditions, natural hazards, social conflicts, and economic fluctuations.
- 4.3.22 Projects should enhance access to quality education and capacity building.

Culture and Heritage

- 4.3.23 Projects must preserve cultural heritage and traditional knowledge.
- 4.3.24 Projects must not alter, damage, or destroy cultural, social, or religious sites, including monuments, places of worship, and other sites of significance.
- 4.3.25 Projects must recognise all land and natural resource users with a legitimate claim, including those holding informal or customary tenure rights.
- 4.3.26 Projects must respect traditional knowledge and not attempt to adapt it to scientific-based knowledge.
- 4.3.27 Where traditional knowledge is utilised, projects must acknowledge and compensate for traditional knowledge transfers.

Resettlement and Displacement

- 4.3.28 Projects must prevent the physical and/or economic displacement and involuntary resettlement of residents and/or their economic activities. Where displacement or resettlement is unavoidable as part of project design, developers must:
 - 1) Demonstrate the indisputable necessity for it. Only the following grounds are acceptable:
 - a) The implementation of the project poses a risk to human life and safety.
 - b) The project represents a critical, widespread public interest.
 - c) The project restores or conserves ecosystems critical for global biodiversity, and in situ restoration or conservation by IPs and LCs is unfeasible.
 - 2) Provide material evidence that it results from a community-based consensus and that alternatives were exhausted. Meeting recordings and signed declarations are the only material evidence acceptable. Equitable Earth and/or the VVB may request a randomised interview to assess the veracity of the document.
 - 3) Appropriately compensate residents or stakeholders to were or will be physically and/or economically displaced as a result of the project.
 - 4) Demonstrate adherence to the <u>International Finance Corporation (IFC)</u>

 <u>Performance Standard 5 on Land Acquisition and Involuntary</u>

 Resettlement.

Social Additionality

- 4.3.29 Projects must strive to achieve social additionality.
- 4.3.30 Projects with IPs and LCs identified as stakeholders must demonstrate social additionality.
- 4.3.31 Developers must ensure that all activities with a social component are aligned with the needs, values, and concerns identified by the IPs and LCs involved in the project.
- 4.3.32 Developers demonstrating social additionality must prepare a social additionality plan that consolidates the activities and outcomes.

- 4.3.33 Developers must ensure the social additionality plan is co-created with IPs and LCs, following FPIC where necessary.
- 4.3.34 The social additionality plan must include:
 - 1) **Summary:** an overview of the social additionality plan, including the main objectives, interventions, key stakeholders impacted, and expected social outcomes.
 - 2) **Objectives:** a clear identification of the key social outcomes the project aims to achieve.
 - 3) **Interventions:** specific actions designed to meet the objectives. Each intervention should follow SMART criteria (specific, measurable, achievable, relevant, and time-bound). These interventions will also contribute to the benefit-sharing plan. Refer to the <u>Benefit Sharing</u> section in the <u>Programme Manual</u> for more details.
 - 4) **Non-Timber Forest Products (NTFPs):** Where relevant, the plan must outline non-timber forest product (NTFP) harvesting and monitoring protocols.
 - 5) **Benefit Sharing:** the detailed benefit-sharing arrangements. Refer to the *Benefit Sharing* section below for more details.

Benefit Sharing

- 4.3.35 Developers must establish a benefit-sharing plan before the design phase, ensuring alignment with national laws and regulations.
- 4.3.36 Developers must identify all community compensation mechanisms and investments in the benefit-sharing plan. They must be:
 - 1) Aligned with the social additionality plan
 - 2) Defined through documented consultation with IPs and LCs and relevant communities
- 4.3.37 The following elements are considered community benefits⁶:
 - Revenue sharing

⁶ These lists are not exhaustive; additional elements may be included if properly justified. However, Equitable Earth has the right to reject any proposed additions.

- Compensation for community members involved in project activities (e.g., restoration activities, monitoring, nurseries)
- Investments in local infrastructure (e.g., roads, water access, renewable energy installations)
- Direct financial contributions or financial mechanisms to community members, cooperatives, or community-managed funds
- Capacity-building programs that enhance skills, knowledge, or technical expertise for community members
- Support for education and vocational training benefiting the local population
- Healthcare initiatives that improve community well-being
- 4.3.38 The following elements are not considered community benefits:
 - Operational and infrastructure costs solely for project use
 - Salaries or fees for project staff, contractors, or consultants from outside the community
 - Certification costs-including audit, expansion, renewal, and monitoring
 - Bank fees
 - Administrative fees
- 4.3.39 For each community benefit, the plan must detail the following:
 - 1) The **form** of the benefit: monetary or in-kind
 - 2) The **recipients** of the benefit: whether on an individual or communal/collective basis
 - 3) The **timeline** and **frequency** of benefit distribution
 - 4) The **amount** or **value of the benefit**: specifying the exact monetary value as a percentage of the total project budget to be allocated for each benefit.
- 4.3.40 If an infrastructure investment serves both the project and the community, developers must submit:

- 1) A **proportionality assessment** estimating what percentage of the infrastructure is for community benefit against project use
- 2) An **agreement** outlining any shared governance or maintenance responsibilities with the community
- 4.3.41 The benefit-sharing plan must be subject to the FPIC process for relevant IPs and LCs before finalisation. In particular, this means that:
 - 4.3.41.1 Developers must provide IPs and LCs with sufficient time and resources to review and understand the plan, including time to share and discuss the plan with their wider communities in an appropriate language and format.
 - 4.3.41.2 Developers must share the plan in a transparent, culturally appropriate, and accessible manner, considering local languages, literacy levels, and customary decision-making processes.
 - 4.3.41.3 Developers must enable negotiation and obtain approval through documented, community-led consultations, ensuring inclusive participation of all relevant community members, including marginalised groups.
 - 4.3.41.4 IPs and LCs must have the opportunity to propose modifications before the plan is finalised and any FPIC agreements are signed.
- 4.3.42 The benefit-sharing plan must be integrated within the <u>Project Design</u>
 <u>Document</u>.

Benefit-Sharing Reporting

- 4.3.43 **Monitoring.** Developers must report annually to Equitable Earth on their expenses specifically related to benefit-sharing.
 - 4.3.43.1 The project budget will facilitate the benefit-sharing reporting by clearly identifying all expenses related to community benefits.
 - 4.3.43.2 All community benefits identified must be reported on, publicly accessible, and disclosed in the Annual Report.
- 4.3.44 **Underperformance.** Developers must justify to Equitable Earth why planned benefits are not distributed as intended, if applicable.

- 4.3.44.1 In such cases, developers must submit a written explanation to Equitable Earth detailing the cause of underperformance within 60 days of the reporting deadline, as well as the associated Corrective Action Plan (CAP). The CAP must include:
 - 1) Root cause analysis of why benefits were not delivered.
 - 2) A revised timeline for benefit distribution.
 - 3) Specific corrective actions, including financial reallocations if necessary.
- 4.3.44.2 Evidence of consultation with affected communities on proposed adjustments.
- 4.3.45 **Grievances.** Stakeholders should use the Equitable Earth Grievance Mechanism to report any concerns, grievances, or suggestions related to benefit sharing. Refer to the <u>Equitable Earth Grievance Mechanism</u> section of the <u>Programme Manual</u> for more details.

5 Ecological Condition Pillar

This section sets out requirements specific to the Ecological Condition Pillar. Additional requirements related to ecological condition can be found at the methodology level.

? Equitable Earth expanded the requirements and criteria in the Ecological Condition (formerly Ecological Recovery) Pillar to accommodate diverse project contexts. In the public consultation, we'd like your feedback on the requirements.

5.1 Ecological Condition Benefits and Safeguards

General Requirements

- 5.1.1 Projects must not harm ecosystems and must deliver net positive ecological condition benefits.
- 5.1.2 Projects must be designed and implemented to meet the requirements set out in this section. Developers must demonstrate conformance with the requirements in the <u>Project Design Document</u> for assessment by Equitable Earth and validation by a VVB.
- 5.1.3 Developers must identify whether the project poses any potential risks related to these ecological condition requirements. Where a potential risk is identified, projects must propose and implement measures to reduce and, as much as possible, mitigate impacts as part of a comprehensive social and environmental risk mitigation plan. Developers must report on the identification, mitigation, and monitoring of risks in the Project Design Document and Annual Report.
- 5.1.4 Developers must conduct an ecological condition baseline assessment in line with the applied methodology, and in partnership with IPs, LCs, and relevant stakeholders.

- 5.1.5 Developers must use public data and/or field data to identify and document any high conservation values (HCVs) within and surrounding the project area, including legally gazetted protected areas as classified by the International Union for Conservation of Nature (IUCN), areas defined as Key Biodiversity Areas (KBAs), wildlife corridors, globally threatened species as classified by the IUCN Red List and any species endemic to the region.
 - 5.1.5.1 Developers must review HCV data with IPs and LCs and local experts, and incorporate local knowledge to make any necessary adjustments.

Ecosystem Extent and Connectivity

- 5.1.6 Projects must not harm, disturb, or damage areas needed for habitat connectivity.
- 5.1.7 Developers must identify, classify and describe human-made barriers to ecological connectivity and their impacts in the project area. Where feasible, developers must strive to mitigate the impact of such barriers. Additional requirements related to ecological connectivity can be found at the methodology level.
- 5.1.8 Projects should strive to promote landscape connectivity between ecosystems and contribute to species dispersal, migration, and movement.
- 5.1.9 Where projects border or consist of ecosystems undergoing disturbances, developers should create buffer zones around the project area, considering the following:
 - 5.1.9.1 The width of the buffer zone should be sized to enable the project objectives.
 - 5.1.9.2 The buffer zone should be as continuous as possible to avoid fragmented buffer patches.

Ecosystem Function

- 5.1.10 Projects must protect and, where applicable, restore ecosystem function.
- 5.1.11 Through the implementation of project activities, developers must strive to:
 - 5.1.11.1 Promote the reproductive viability of the protected and/or restored forest ecosystems, such as the availability of resources for natural

- pollination, seed dispersal and gene flow within and across taxonomic groups.
- 5.1.11.2 Mitigate the impact of future changes in local climate and extreme weather events on ecosystem function.

Biodiversity

- 5.1.12 Projects must demonstrate a net positive impact on the health and biodiversity of terrestrial and, where relevant, marine ecosystems.
- 5.1.13 Projects must not convert existing natural forest, grasslands, croplands, wetlands (including peatlands), or High Conservation Value (HCV) habitats.
- 5.1.14 Projects must not harm, disturb, or damage the available habitat for native, or rare, endangered, or threatened species, as defined under the project's local, regional, or national jurisdiction, or any international scheme or database such as the IUCN.
- 5.1.15 Projects must not introduce any invasive species or allow an invasive species to thrive as part of project activities. The applied methodology may provide further guidance or requirements on the use of species.

Indicator and Keystone Species

- 5.1.16 Developers must identify indicator species that are sensitive to changes in ecosystem health, and keystone species that can disproportionately affect ecosystem function within the project area.
- 5.1.17 Developers must strive to monitor the presence of relevant indicator and/or keystone species that have been selected with input from experts with knowledge of the local ecology and, where relevant, someone holding traditional or local ecological knowledge of the ecosystem.

Soil

- 5.1.18 Projects must strive to restore and/or maintain soil health, including soil fertility, soil biodiversity, nutrient cycling, and preventing soil erosion.
- 5.1.19 Developers must implement measures to prevent soil erosion and reduce soil erosion on slopes. Measures may include hedge and tree rows, natural terracing, infiltration strips, or permanent ground cover.

5.1.20 Projects must not harm soil quality and must prevent further ecosystem degradation. This includes avoiding and minimising adverse effects on organic content, water retention capacity, and productivity of the soil.

Water

- 5.1.21 Developers must optimise water consumption to avoid excessive use and prevent water stress associated with project activities.
- 5.1.22 Where applicable and feasible, projects must:
 - 5.1.22.1 Protect and, where applicable, restore freshwater sources within and around the project area.
 - 5.1.22.2 Maintain the natural purification and filtration functions of the ecosystem.
 - 5.1.22.3 Enhance and, where applicable, restore the capacity of the ecosystem to regulate water flow, reducing the risk of future flood events by restoring watersheds, floodplains, and water cycles.

Waste, Pollution, and Hazardous Substances

- 5.1.23 Projects must avoid employing techniques for ecological restoration and conservation that may lead to the release of hazardous waste/materials to land, water, or air as this may harm ecosystem function.
- 5.1.24 Where project activities lead to the release of hazardous material, projects must manage and/or dispose of it in line with relevant national, regional, and local regulations or recognised best practices.
- 5.1.25 Projects must strive to minimise and, where possible, avoid the use of chemical pesticides, fungicides, and insecticides. Strategies may include, but are not limited to integrated pest management systems and or integrated vector management.
- 5.1.26 Developers must identify and, where applicable, minimise and mitigate any impacts related to pollutant emissions to air, noise, and vibration.

Ecosystem Services

5.1.27 Projects must protect and, where applicable, restore ecosystem services.

- 5.1.28 Through the implementation of project activities, developers must strive to:
 - 1) Protect and, where applicable, restore provisioning services, such as Non-Timber Forest Products (NTFPs) that IPs and LCs receive from the forests.
 - 2) Protect and, where applicable, restore the cultural and recreational values and well-being benefits of the ecosystem in the project area.

Ecosystem Threats

- 5.1.29 Developers must systematically identify and analyse threats and drivers of ecosystem damage and degradation from anthropogenic, natural and climatic causes and define interventions that effectively address them.
- 5.1.30 Developers must mitigate the risk of unintended fires by preparing a fire prevention and management strategy for the project area. This strategy must include a risk assessment and corresponding mitigation actions (e.g., training, dedicated infrastructure, provision of equipment) to be implemented.
- 5.1.31 Developers must strive to implement interventions to positively impact the ecological condition of the project by considering the long-term context of a changing climate and its future effects on landscapes and ecosystems.

6 Carbon Pillar

This section sets out requirements specific to the Carbon Pillar. Additional requirements related to carbon can be found at the methodology level.

6.1 Baseline Scenario

- 6.1.1 Projects must establish a baseline scenario that represents what would occur without the intervention of the project. Existing government policies and legal requirements that lower GHG emissions must be considered when determining the baseline scenario and baseline emissions.
- 6.1.2 Projects must determine the baseline scenario following the applied methodology.
- 6.1.3 Equitable Earth estimates baseline emissions following the applied methodology.

6.2 Additionality

- 6.2.1 Projects must demonstrate that the net GHG removals to be generated would not have been possible without the revenue from sales of ECUs.
- 6.2.2 Projects must demonstrate additionality in line with the requirements and procedures set out in the latest version of the applied methodology.

6.3 Quantification of Net GHG Removals

- 6.3.1 The net GHG removals from project activities must be robustly quantified, based on conservative approaches and scientific methods.
- 6.3.2 Equitable Earth quantifies and provides an ex-ante estimation of net GHG reductions and removals on the basis of selected and applied methodology. The estimation must include at least the following:
 - Determination of project boundary, including selection of relevant GHG sources, sinks and reservoirs

- 2) GHG emissions, GHG stock changes, GHG reductions and removals for baseline, project, and leakage emissions
- 3) Total net GHG removals for the crediting period
- 4) Uncertainty
- 5) Annual average of net GHG reductions and removals
- 6.3.3 Equitable Earth quantifies the net GHG reductions and removals of the project before each verification throughout the crediting period.
- 6.3.4 Carbon parameters established in the applied methodology must be monitored, and must include a GHG information system to obtain, record, and analyse GHG data, quantification methods, and quality management systems.

Leakage

- 6.3.5 All projects must assess the risk of leakage and apply appropriate mitigation, monitoring, and quantification measures, as set out in the applied methodology.
- 6.3.6 Equitable Earth methodologies include specific criteria requiring projects to:
 - 1) Identify potential sources of leakage relevant to the intervention type
 - 2) Implement strategies to reduce the displacement of emissions wherever feasible
 - 3) Monitor and report on leakage throughout the crediting period
 - 4) Quantify and deduct any significant leakage emissions from project GHG reductions and removals
- 6.3.7 Positive leakage (i.e., emission reductions occurring outside the project area as a result of the project) is not included in net GHG reduction or removal calculations as a measure of conservativeness.

Permanence

6.3.8 The GHG reductions and removals from project activities must be permanent. Where there are risks associated with the reversal of achieved GHG reductions and removals, projects must assess the associated GHG reversal risks, employ mitigation measures, and compensate for reversals during the crediting period.

- 6.3.9 Projects must demonstrate permanence following the requirements of the applied methodology.
 - 6.3.9.1 Reversal risks must be assessed and mitigated following the requirements laid out in the *Risk Management* section.
 - 6.3.9.2 Loss events must be monitored, reported, quantified, and compensated.

 More details regarding the procedures related to these requirements can be found at the methodology level.
- 6.3.10 Projects must assess risk, including non-permanence risk, in line with the requirements established in the <u>Risk Management</u> section of both the <u>Programme Manual</u> and this document.
- 6.3.11 Developers must assess whether dangerous activities occur in the surroundings of the project area and implement safeguards to prevent negative impacts on the project area. Dangerous activities include, but are not limited to, chemical processing/treatment, non-organic industrial agriculture or animal farming, waste treatment facilities, and any other activity generating classified dangerous residues.
- 6.3.12 Projects must apply methodology-specific safeguards to mitigate the GHG reversal risks. The safeguards must be appropriately and adequately designed and implemented for the ecosystem and the project area.
- 6.3.13 Equitable Earth monitors loss events using remote sensing throughout the project lifetime and for 100 years after the end of the project lifetime.
 - 6.3.13.1 Equitable Earth quantifies the impact of loss events before each verification. After quantification, Equitable Earth will deduct the impact of loss events from project GHG reductions and removals in that verification period. If the loss event(s) led to net GHG loss, this will be qualified as a reversal.
- 6.3.14 If reversals occur during the crediting period, ECUs must be compensated through the buffer pool mechanism. Refer to the <u>Compensation of Reversals</u> section in the <u>Programme Manual</u> for more details.

Buffer Pool Contributions & Compensation of Reversals

6.3.15 Equitable Earth manages a common buffer pool to mitigate non-permanence risk and to compensate for any potential loss of carbon stock from a registered project.

- 6.3.16 All projects must allocate 20% of verified GHG reductions and removals into the pooled buffer account at the time of VRU issuance.
- 6.3.17 ECUs held in the buffer pool must not be traded or sold. Refer to Section <u>Buffer Pool</u> of the <u>Programme Manual</u> for more details on procedures for depositing buffer credits, and section <u>Compensation of Reversal</u> of the <u>Programme Manual</u> for the reversal procedures.

7 Sustainable Development Goals

- 7.1.1 Projects must demonstrate a positive impact on at least three <u>United Nations</u>
 <u>Sustainable Development Goals</u> (SDGs), noting that:
 - 7.1.1.1 Contribution to SDG 13 (Climate Action) is demonstrated by net GHG reductions and removals achieved by the project.
 - 7.1.1.2 Contribution to SDG 15 (Life on Land) is demonstrated through project design and implementation following the Ecological Condition principles and methods outlined in the latest version of the applied methodology.
 - 7.1.1.3 Contribution to at least one relevant socially oriented SDG (such as SDG 1, SDG 2, SDG 3, SDG 4, SDG 5, and SDG 10, among others) is demonstrated by project design and implementation following the Livelihoods principles and methods outlined in the latest version of the Standard.
- 7.1.2 Developers must report on SDG contributions and demonstrate how SDG contributions align with the host country's SDG objectives, where relevant, by:
 - 7.1.2.1 Selecting and populating appropriate targets and indicators
 - 7.1.2.2 Describing alignment with the host country's objectives, with the relevant national policies, strategies, or official reports cited as references
 - 7.1.2.3 Reporting on SDG contribution information
 - 7.1.2.4 Monitoring indicators using one or more of the standardised methods set out by Equitable Earth
 - 7.1.2.5 Reporting annual progress in the <u>Annual Report</u>
 - 7.1.2.6 Reporting ongoing monitoring results for assessment by Equitable Earth and periodic verification by a VVB
- 7.1.3 Refer to the <u>Monitoring, Reporting, & Verification Requirements</u> for more details on reporting and monitoring requirements on SDG contributions.

8 Monitoring, Reporting, and Verification (MRV) Requirements

8.1 Monitoring

Monitoring Applicable to Equitable Earth

- 8.1.1 Equitable Earth monitors the following information for each carbon parameter:
 - 1) A description
 - 2) The unit used to monitor their progress
 - 3) The equations that use the parameter in the applied methodology
 - 4) The source of data
 - 5) Where applicable, the monitoring procedure and frequency
 - 6) Where applicable, the quality assurance and quality control procedures
- 8.1.2 Equitable Earth monitors project areas and, where applicable, their leakage belts, using remote sensing and satellite imagery. Projects are monitored over a 100-year period from the end of the project lifetime to track forest cover change and to detect loss events.
- 8.1.3 Equitable Earth uses the Global Forest Watch (GFW) integrated deforestation alerts to provide continuous monitoring of such events. This system automatically generates alerts whenever land cover changes are detected. In the event of any reversals, refer to the <u>Compensation of Reversals</u> section in the <u>Programme Manual</u> for more details.

Monitoring Applicable to Projects

- 8.1.4 For each indicator to be monitored, developers must provide:
 - 1) A detailed description of the indicator
 - 2) The unit used to monitor its progress

- 3) The methods that will be used to collect the information. This must include project team members responsible for monitoring.
- 8.1.5 All indicators must be adequately and appropriately compiled in the Monitoring Plan in the <u>Project Design Document</u>, and reported on annually in the <u>Annual Report</u>.

8.2 Reporting

Reporting Applicable to Equitable Earth

- 8.2.1 Before each verification, Equitable Earth compiles a GHG Monitoring Report that consolidates the net GHG reductions and removals achieved during the previous verification period. The GHG Monitoring Report must contain the following information:
 - 1) Project location
 - 2) Net GHG reductions and removals resulting from the monitoring of relevant carbon parameters, along with detailed calculations for the period covered
 - 3) Carbon parameters monitored and their corresponding quality assurance and quality control criteria
- 8.2.2 The <u>GHG Monitoring Report</u> must be included as an appendix to the <u>Annual Report</u> and the Project Monitoring Report. For projects undergoing validation and verification concurrently, the <u>GHG Monitoring Report</u> will be provided by Equitable Earth as a separate report.
- 8.2.3 Developers are required to report on loss events throughout the project lifetime and provide:
 - 1) The description and date of the loss event
 - 2) A shapefile delimiting the total area and location of the loss event
 - 3) The nature of the loss event (i.e., avoidable or unavoidable), and documentation to back up the claim
 - 4) The impacts on project activities

Reporting Applicable to Projects

- 8.2.4 Projects must submit an <u>Annual Report</u> to Equitable Earth throughout the project lifetime. It must consolidate the results of all indicators monitored by the project over the previous 12 months to Equitable Earth annually, throughout the project lifetime.
- 8.2.5 Developers must report on:
 - 1) The project implementation status, including how the FPIC process was followed, where applicable
 - 2) Project deviations
 - 3) Realised expenses, including any expenses related to benefit-sharing
 - 4) Results of the monitoring plan, including the evolution of indicators and a summary of performance and challenges encountered.
 - 5) Loss events following the reporting procedures in the applied methodology
 - 6) Adjustments for the subsequent year
- 8.2.6 Prior to verification, developers must prepare a Project Monitoring Report. The Project Monitoring Report combines information from the Annual Reports of the years since the previous verification. The Monitoring Report replaces the Annual Report in verification years (i.e., Annual Reports are not required to be submitted in verification years).
- 8.2.7 Monitoring Reports are reviewed by Equitable Earth and verified by a VVB.

Appendix A: Documentation History

Version	Date	Comment
1.1	05/07/2024	Public release of version 1.1 of the Equitable Earth Programme.
1.1	26/07/2024	Update for minor typographical revisions.
1.1	28/11/2024	Updates to address the accreditation Clarification Request. Main updates include:
		Section 'START DATE & CREDITING PERIOD' (page 11) Section is renamed 'KEY PROJECT DATES & CREDITING PERIOD' Added subsection 2 to define the concept of registration date. Section 'ROBUST QUANTIFICATION' (page 15) Added subsection on Dynamic Baseline. Clarified the conservativeness section regarding the alignment with the Aboveground Woody Biomass Product Validation Good Practices Protocol. Added subsection on leakage emissions. Section 'SAFEGUARDS' (pages 21-24) Modified subsection 1 to clarify social safeguards requirements, specifically regarding FPIC and IPs & LCs. Modified subsection 2 to clarify the environmental safeguards requirements of the Programme. Section 'SUSTAINABLE DEVELOPMENT GOALS' Modified section on SDG contribution and selection requirements using the SDG Tool and MRV procedures (page 25). Section 'PROJECT DESIGN REVIEW' (page 36-38) Clarification on how rights-holders include customary rights-holders. Section 'ESTABLISHING DATA FOR MONITORING' (page 39) Modified the Project Interventions subsection to include requirements for the selection of SDG indicators and the use of the SDG Contribution Tool.
		Section 'PROGRAMME PROCEDURES' (page 64) • Added section on active stakeholder feedback
1.1	26/02/2025	Updates to address accreditation Clarification Request. Main updates include:
		Section 'KEY PROJECT DATES AND CREDITING PERIOD' (page 11) • Modified the definition of project registration date to align with Equitable Earth Registry updates. Section 'OWNERSHIP AND CARBON RIGHTS' (page 12) • Clarified that ownership requirements are applicable to

DRAFT FOR PUBLIC CONSULTATION | Equitable Earth Standard 48

		customary land tenure held by a party other than the Developer. Section 'CORE CARBON PRINCIPLES - ROBUST QUANTIFICATION' (page 15) • Added section on baseline scenario. Section 'STAKEHOLDERS PARTICIPATION' (page 22) • Clarified language related to ongoing stakeholder consultation. Section 'SUSTAINABLE DEVELOPMENT GOALS' (page 28) • Clarified SDG contribution reporting requirements
1.1	27/03/2025	Updates to address accreditation Clarification Request. Main updates include: Section 'GOVERNANCE & SAFEGUARDS (page 75) • Modified the organisational chart to include the Governing Board as Equitable Earth's highest governing authority
1.2	01/08/2025	Public release of version 1.2 of the Equitable Earth Programme. The complete list of revisions and updates to the documentation is available at the following <u>link</u> .
1.3	21/08/2025	Version for public consultation.
